# HCI Lectures 1–18 | Important Short Questions, Long Questions & MCQs (with Answers)

**SHORT QUESTIONS (With Easy Answers)**

1. What is HCI?

HCI is the study of how humans interact with computers and how to design easy and user-friendly systems.

2. What is the main goal of HCI?

To make computer systems simple, efficient, comfortable, and error-free.

3. What is usability?

Usability means how easy a system is to learn, use, remember, and how few mistakes it causes.

4. What is Human-Centered Design?

A design method that focuses on user needs, limits, skills, and behavior.

5. What is a mental model?

The picture or idea a user has in mind about how a system works.

6. What is working memory?

Short-term memory used while thinking or doing tasks; very limited capacity.

7. What is long-term memory?

Memory that stores information for a long time, like rules, language, and knowledge.

8. What is perception?

How users understand information they receive through senses, especially vision.

9. What are interaction styles?

Ways users interact with computers: menus, forms, CLI, direct manipulation.

10. What is direct manipulation?

Interacting with on-screen objects directly, like dragging icons.

**LONG QUESTIONS (With Easy Answers)**

1. Importance of HCI

HCI makes technology easier and better to use. It reduces errors, saves time, increases user satisfaction, and helps beginners, experts, old people, and disabled people use systems easily.

2. Human Information Processing Model

This model explains how humans receive, store, and use information:

• Sensory Memory – receives input through senses.

• Working Memory – holds small info for a short time.

• Long-Term Memory – stores info permanently.

Designers must keep memory limits in mind to avoid overload.

3. Usability and Its Components

Usability includes:

• Learnability – easy to learn.

• Efficiency – fast to use.

• Memorability – easy to remember.

• Errors – fewer mistakes.

• Satisfaction – user feels comfortable.

4. Interaction Styles

• CLI – typing commands.

• Menus – selecting options.

• Forms – structured input.

• Direct Manipulation – drag & drop, icons.

Each style suits different users and tasks.

5. Human Factors

Designers must consider:

• Physical factors – vision, hearing, motor ability.

• Psychological factors – stress, fatigue.

• Cognitive factors – memory limits, attention.

• Experience level – beginner, intermediate, expert.

**MCQs (With Answers)**

1. HCI stands for:

A) Human Computer Interaction

Answer: A

2. Which memory has limited capacity?

A) Working memory

Answer: A

3. Direct manipulation means:

B) Dragging objects on screen

Answer: B

4. Which is NOT an interaction style?

D) Electricity flow

Answer: D

5. Usability focuses on:

B) User satisfaction and ease-of-use

Answer: B

6. Norman’s model is based on:

A) Execution and evaluation

Answer: A

7. Expert users are:

C) Users with high experience

Answer: C
